Continuation of 11. does NOT place the application in condition for allowance because: the applicant's arguments are not found persuasive. The applicant argues that Bergler et al. does not disclose means "provided for automatically adjusting the oscillation stroke ... as a function of the pressure of the saw blade". Instead, the applicant argues that Bergler et al. disclose a manual switching lever (22), which is not automatic, for adjusting the oscillation stroke smoothly between the maximum and minimum stroke during the sawing process.

The applicant's arguments have been considered, however, it is observed that although the adjusting of the switch lever is not automatic in response to a function of the pressure, the mechanical response to the adjusting of the switch lever is considered automatic. Such that in accordance with the applicant's claim, "wherein means (the switch lever) is provided for automatically adjusting the oscillation stroke (when the lever is actuated, the stroke is automatically although mechanically adjusted) between the maximum and minimum stroke (capable of being adjusted to the max. and min. stroke depending upon the adjustment of the lever) during the sawing process. The claim limitation that further imparts the requirement that the means are provided for automatic adjustment of the stroke as a "function of the pressure of the saw blade against a work piece to be sawn" was also considered. However, the claim does not set forth that means automatically adjust as an automatic response to a function of the pressure, only that the means are actuated as a function of the pressure; such that an operator is capable of continuously operating the means (the switch lever) as a function of the pressure (that resistance to the saw machine that he feels during operation) that automatically adjust the oscillation stroke (as set before; when the lever is actuated, the stroke is automatically although mechanically adjusted).
